Our Git Process was as follows: Our master branch was used as the development branch. There was no daily commits required. All commits were done as classes were completed or fixed. Each team member had a branch named after them to create and modify their classes. Each team member made their classes on their local directory, added it to their local repository, committed with message format “[Team Member] committing [ClassName/JavaDocName]”, “[Team Member] fixing [ClassName/JavaDocName]”, or “[Team Leader] merging [BranchName]” and then pushed their changes to their remote branch. We made the decision that the team leader would be the individual to merge branches to the master/development branch and tag the releases on the master/development branch.
